Tenure Summary

Birmanie Nominees Pty Ltd was granted Exploration Permit for Coal (EPC) 2197 totaling 250 sub blocks on 25th February 2011 for a period of 5 years. This EPC was given the project name of ‘South Blackall’.

The tenement is located approximately 100km west northwest of Charleville, Central Queensland and was selected following an extensive study of historical petroleum drill holes in the area.

On April 23rd 2012 Pursuant to Section 151 of the Mineral Resources Act 1989, Birmanie Nominees Pty Ltd assigned 100% interest in EPC 2197 to Gen Resources Pty Ltd (100% owned by International Coal Ltd (ASX: ICX) and Gen Resource Pty Ltd became the registered owner of EPC 2197.

The tenement is on the Lake Dartmouth 1:100 000 geology sheet no 7945 EPC2197 “Broughton Creek South West” lies between the latitudes of 21° 05’S and 21° 07’S and the longitudes of 140° 00’E and 140° 02’E - See **Figure 1 and 2**.

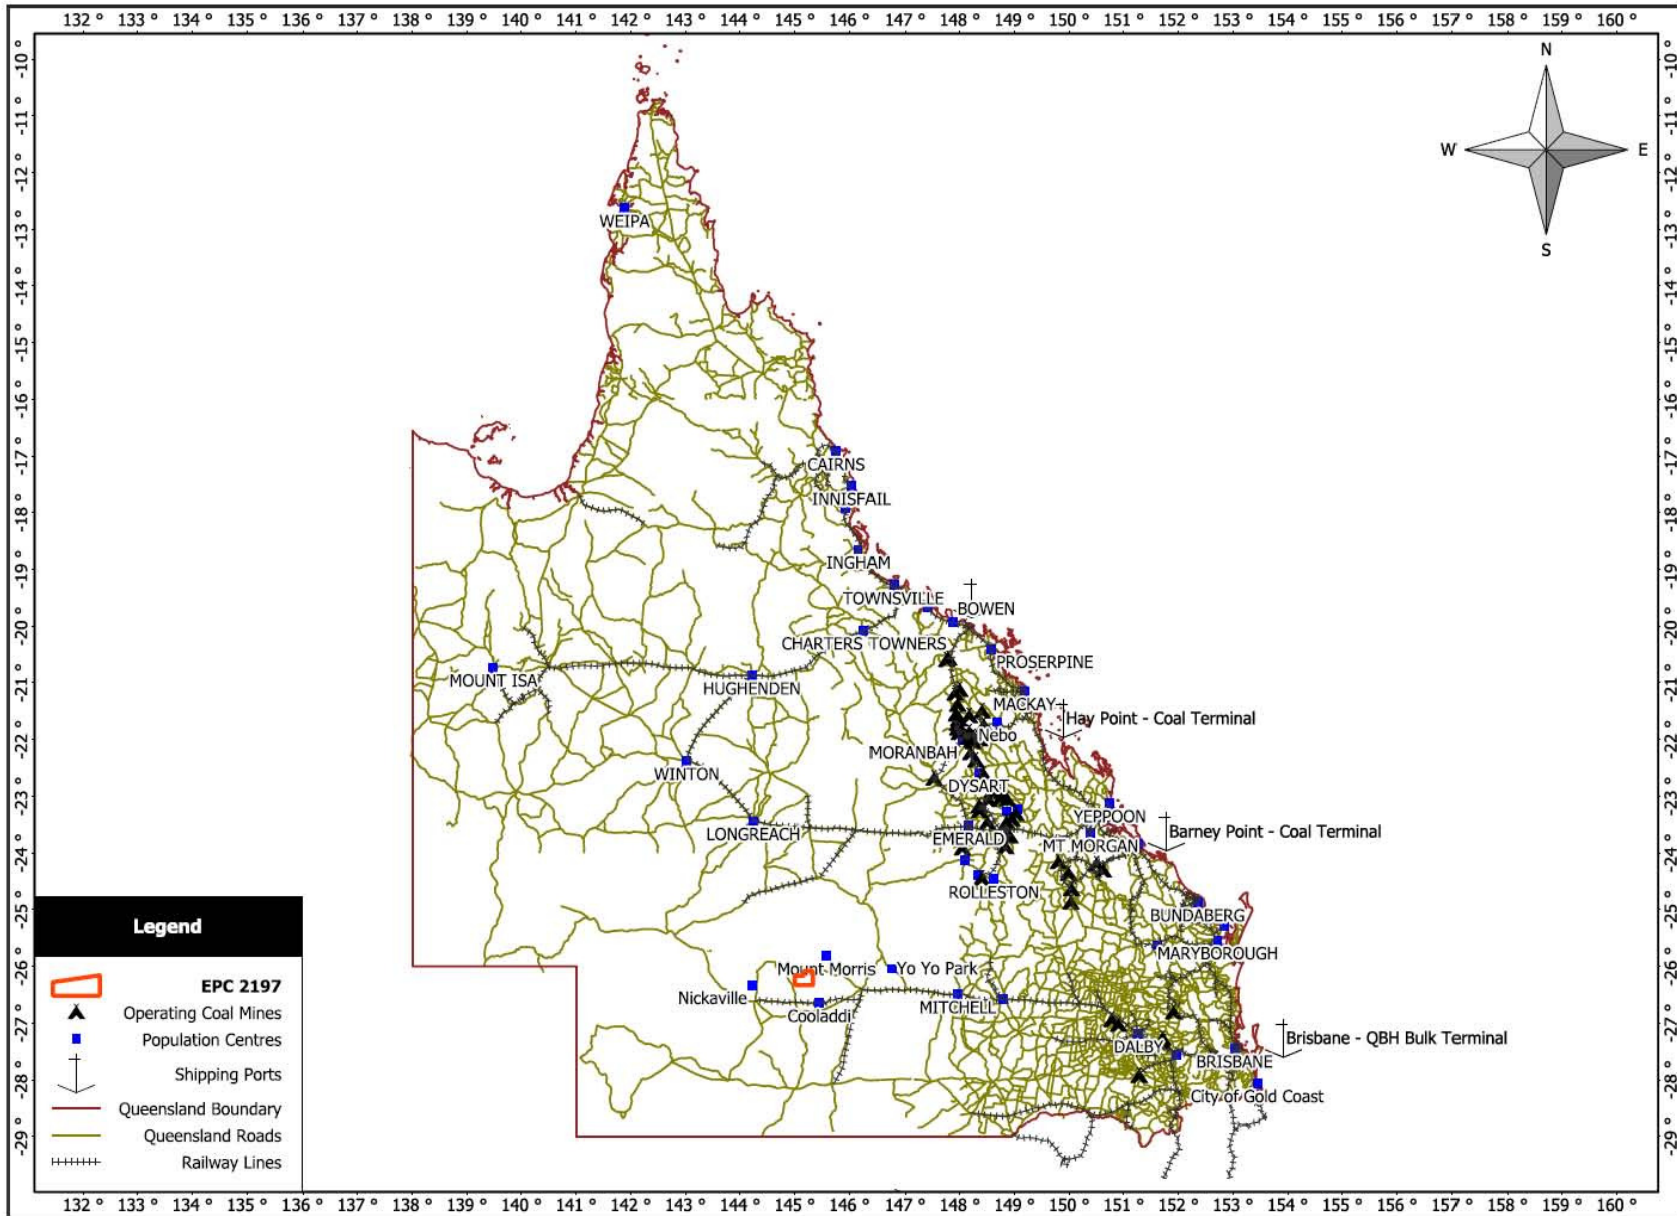

Figure 1 - General Location Map

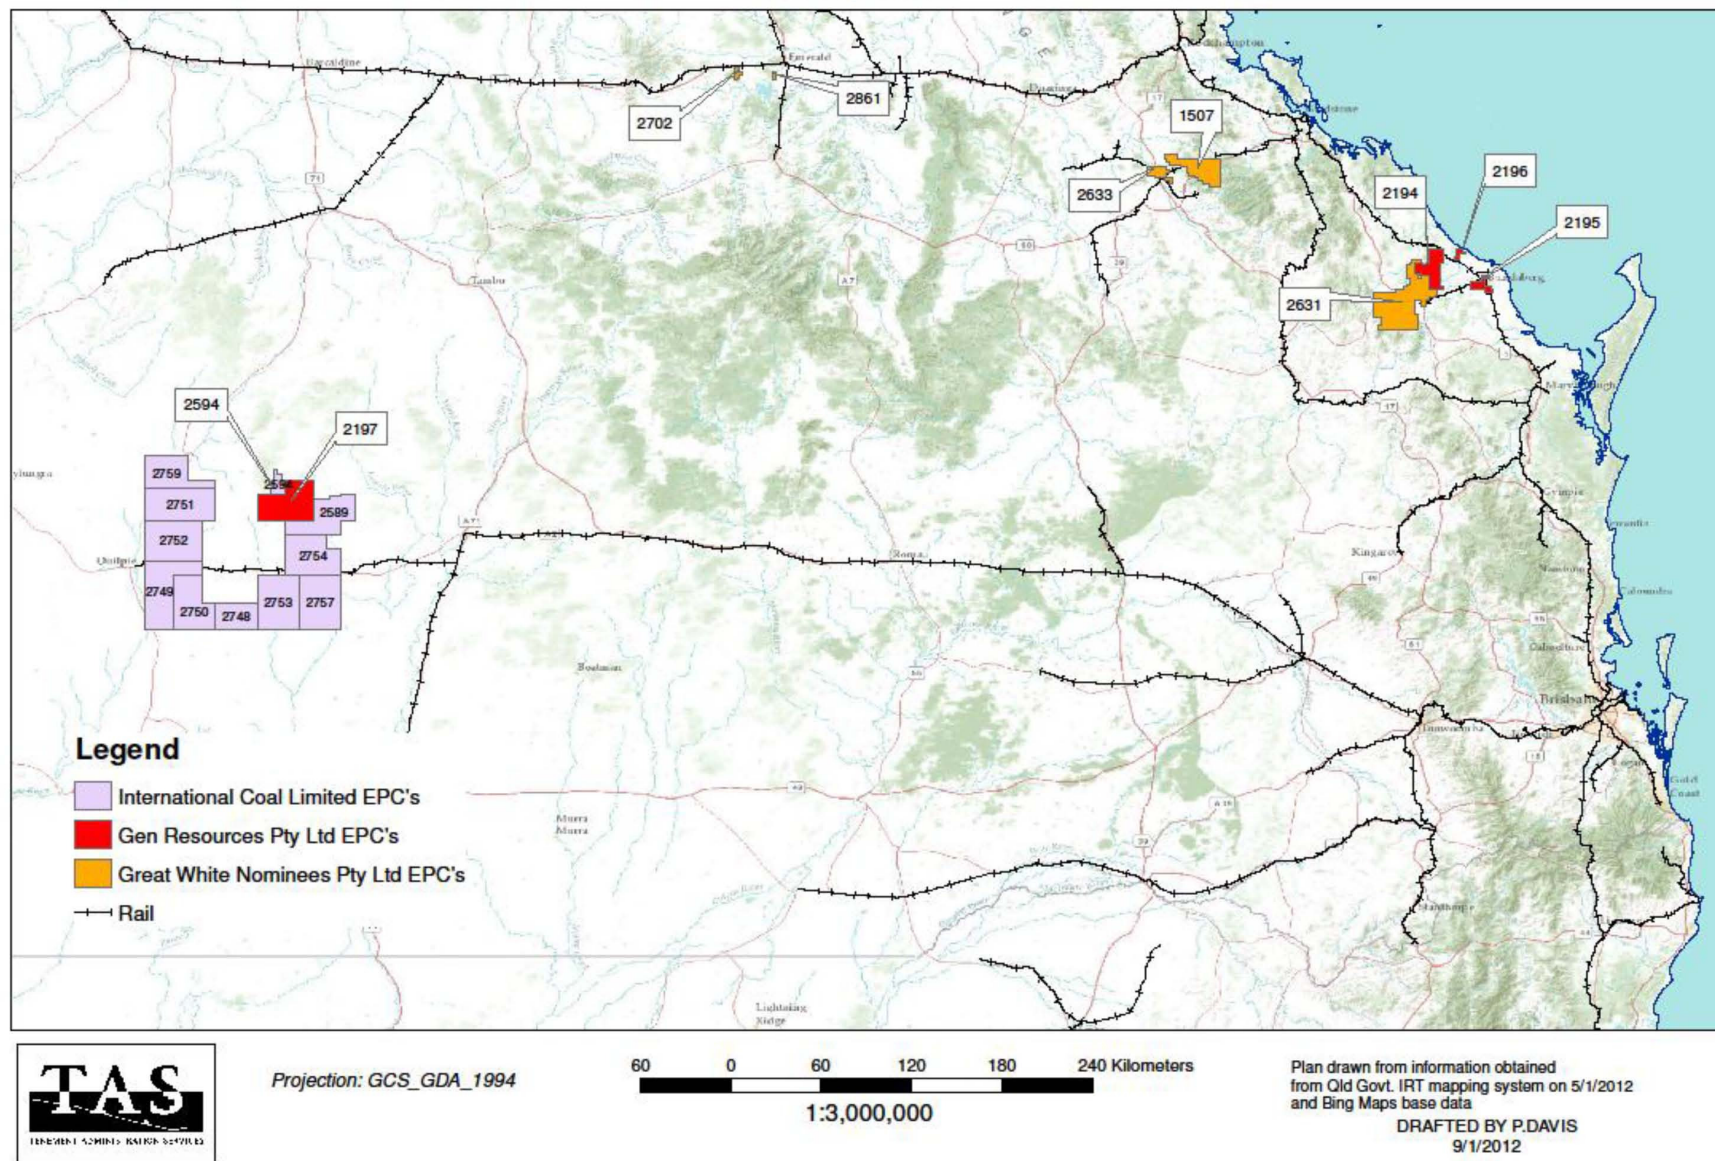

Figure 2 - South Blackall Location Map

Exploration Permit for Coal 2197 “South Blackall” currently comprises 200 sub - blocks covering the Lake Dartmouth 1:100 000 geology sheet no 7945 after Gen Resources Pty Ltd submitted 50 sub-blocks for prescribed partial relinquishment on the 25th of January 2013. As of the 24 Feb 2013 EPC 2197 comprises the following sub-blocks:

| Block | Sub-blocks |
|-------|---|
| 1815 | A B C D F G H J L M N O P Q R S T U V W X Y Z |

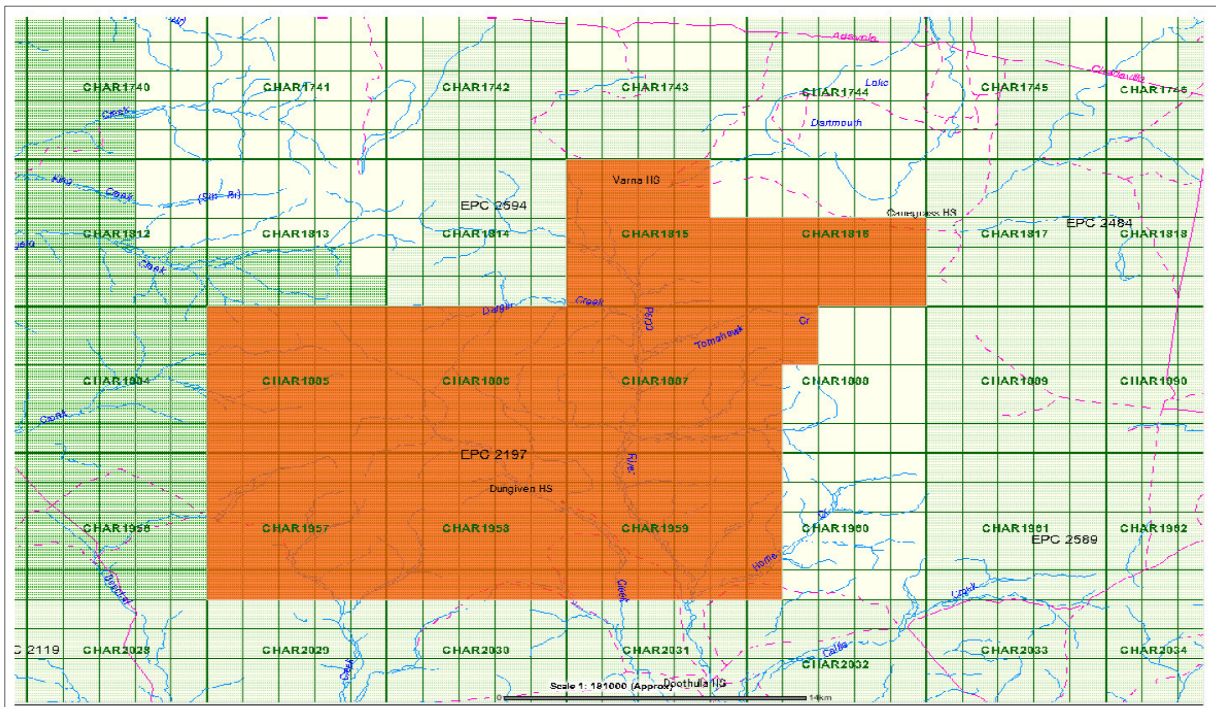

Figure 3 - South Blackall Sub Block Location Map

Philosophy and Objective Statement

This is the second Annual Report produced for EPC 2197 it includes a statement detailing the philosophy and objectives of the exploration on the permit in accordance with section 13B(a) of the Mineral Resources Act (MRA, 1989).

The South Blackall Project area lies within the Eromanga Basin in western Central Queensland. It was applied for with the objective of discovering large, shallow coal deposits capable of being beneficiated to a standard of thermal quality, in particular, product coal with calorific values ranging from 5,300 – 5,800 kcal/kg (gross air-dried basis). The desired minimum seam thickness is 1 – 2 m.

Figure 4 - Basin Location Map

The primary focus for exploration is the Eromanga Basin’s Winton Formation, with the secondary focus on the Mackunda Formation, which directly underlies the Winton Formation (**Figure 7**). Year 2 exploration focus was on determining the depth, thickness and lateral continuity of the coal seams within these formations across the tenement.

A regional aeromagnetic survey was run by the Department of Minerals and Environmental Research in 2009, and a regional gravity survey was run by the Department of Minerals and Environmental Research in 2007. A map of the aeromagnetic response in the vicinity of EPC 2197 is shown in **Error! Reference source not found. 5**, and the regional gravity survey in the vicinity of EPC 2197 is displayed in **Figure 6**.

Figure 5 - Regional Aeromagnetic Survey Map

Figure 6 - Regional Gravity Survey Map

Summary of Authorised Activities – Year 2

Section 13B(b) of the MRA (1989) requires the annual report for EPC 2197 to include a technical summary of the exploration activities carried out. The activities are listed below and the results are summarised in this section. The activities exceeded the requirements under the special conditions of the tenure which only required 6 RAB holes to be drilled within a scout drill program followed by further analysis and interpretation of the results.

A total of sixteen (16) holes were drilled for 2,855.7m of chip and 161.95m of HQ-sized diamond core as shown in the table (Table 1) below:

Table 1 - Collar Details for boreholes drilled within EPC 2197

| Borehole | Easting_z55 | Northing_z55 | CRL | Total Depth (m) |
|----------|-------------|--------------|--------|-----------------|
| SB001 | 313487 | 7091730 | 336.6 | 210 |
| SB001R | 313490 | 7091735 | 336.45 | 224 |
| SB002 | 310010 | 7090330 | 346.3 | 250 |
| SB002R | 310015 | 7090325 | 346.1 | 205 |
| SB003 | 306920 | 7088430 | 319.2 | 215 |
| SB003R | 306920 | 7088430 | 318.95 | Pad ready |
| SB004 | 303850.3 | 7090325.5 | 320.3 | 192 |
| SB004R | 303855 | 7090330 | 320.05 | 200 |
| SB006A | 314191 | 7095430 | 342.1 | 8 |
| SB006R | 314188 | 7095425 | 342.1 | 204 |
| SB007 | 310540 | 7097440 | 349 | 224 |
| SB007R | 310543 | 7097432 | 349.2 | 206 |
| SB012 | 310650 | 7093970 | 349.7 | 6 |
| SB012R | 310655 | 7093971 | 349.5 | 248 |
| SB013 | 307570 | 7091620 | 348.8 | 200 |
| SB014 | 307380 | 7095800 | 350.6 | 206 |
| SB014C | 307389.5 | 7095792.3 | 350.25 | 203.6 |

A total of sixteen boreholes were drilled in 2012, with one of these holes taking HQ-sized core from the twenty-two (22) main target seams. Drilling typically extends down to 150m; however, approximately 20% of holes were drilled to 250m to identify the potential for deeper resources. The Stage 2 drilling program boreholes also faced difficult drilling conditions with the weak clastic strata (as identified by geotechnical lab testing in SB014C) causing unstable sidewall conditions. All have been downhole geophysically logged, albeit mostly through HQ rods.

Thirty-nine seams were identified, of which 22 seams were deemed suitable for modelling based on consistency across the tenement and thickness (greater than 0.20m). Correction of coal seams to geophysical logging has been completed, with slightly thicker seams being encountered in Stage 2 drilling. Interpretation of individual coal seams was challenging as all boreholes were logged through steel HQ rods, and drilling in the eastern part of the EPC has shown to be in an area of depressed groundwater levels such that the boreholes are often dry until about 80m.

Table 2 - SB016 Depth of the WIN03 seam

| Seam Name | From (m) | To (m) | Thick (m) | Description | Comment |
|-----------|----------|------------------|-----------|-------------|------------------------------|
| WIN03U | 92.13 | 93.66 | 1.53 | C7 | Dull coal |
| parting | 93.66 | 93.96 | 0.33 | CM | Carbonaceous mudstone |
| WIN03L | 93.96 | 97.69 | 3.69 | C6 | Dull coal minor bright bands |
| | | <i>Sub-total</i> | 5.56 | | |

Drilling has established that the Resource gently dips to the south and east and is relatively flat. No significant geological structures have been identified at South Blackall. The surface topography is gently undulating and has minor drainage across the land and in the west, a slight topographical high is present in the form of Mt Gibson.

Laboratory testing confirms that the minimum raw ash level is 9.0% with a mean of 26.7% across 57 samples (adb). It is anticipated that some of the lower seams in the resource could potentially bypass any beneficiation process. The mean raw volatile matter is 31.5% (adb) and the raw coal has an average GCV of 20.11 MJ/kg and 4,803 kcal/kg (adb).

Washed coal would target products of 12% to 16% ash, with laboratory yields in excess of 70%. Washability tests clearly indicate that the Winton Formation Coals are low total sulphur, high volatile products, with a washed CGV around 5,150 Kcal/kg (adb). A feature of the South Blackall deposit is that weathering is comparatively deep with fresh coal often not located until a 30m depth with coal identified above the weathering profile having been excluded from the Resource estimate. The prospective Resources are at shallow (seam sub-crop from 35m) to moderate depth (200m drilling extent).

Figure 8 - SB016 Downhole geophysical trace, WIN03 seam

Statement of Resources and Reserves, Significant Mineralisation and Structure

In accordance with section 13B(e and f) of the MRA (1989), details of resources, reserves and structure are summarised in this section.

A Minescape Structural model for the South Blackall deposit was generated based on additional drilling information made available from the Stage2 Exploration Program (**Table 3**) completed during July to September 2012. The locality the Winton Formation hosts four coal intervals separated by several metres to several tens of meters of non-coal sedimentary rocks, with the lowest coal interval nonconformable with the upper 3 sequences. Each coal interval contains variably between five (5) and twelve (12) seams, each usually 0.3 to 1.2 m thick interbedded with inferior coal, coaly shale, and carbonaceous mudstone. Several coal seams up to 0.8m were also encountered in the underlying Mackunda Formation, interbedded with calcareous mudstone and limestone.

Table 3 - Stage 2 Exploration

| Borehole | Easting_Z55 | Northing_Z55 | AHD | Total Depth | Comments |
|-----------------|--------------------|---------------------|------------|--------------------|----------------------------|
| | <i>m</i> | <i>m</i> | <i>m</i> | <i>m</i> | |

| SB016 | 306656.48 | 7102637.27 | 343.90 | 247.00 | Stage 2 |

Drilling has enabled detailed assessment of the coal seam characteristics at South Blackall. Due the variable nature of the seam splitting and coalescing, it has been deemed prudent by the Competent Person to reduce the diameter of the underlying base circles used as a basis for the construction of the Inferred Mask from 4,000m to 3,600m, as illustrated in **Figure 9**.

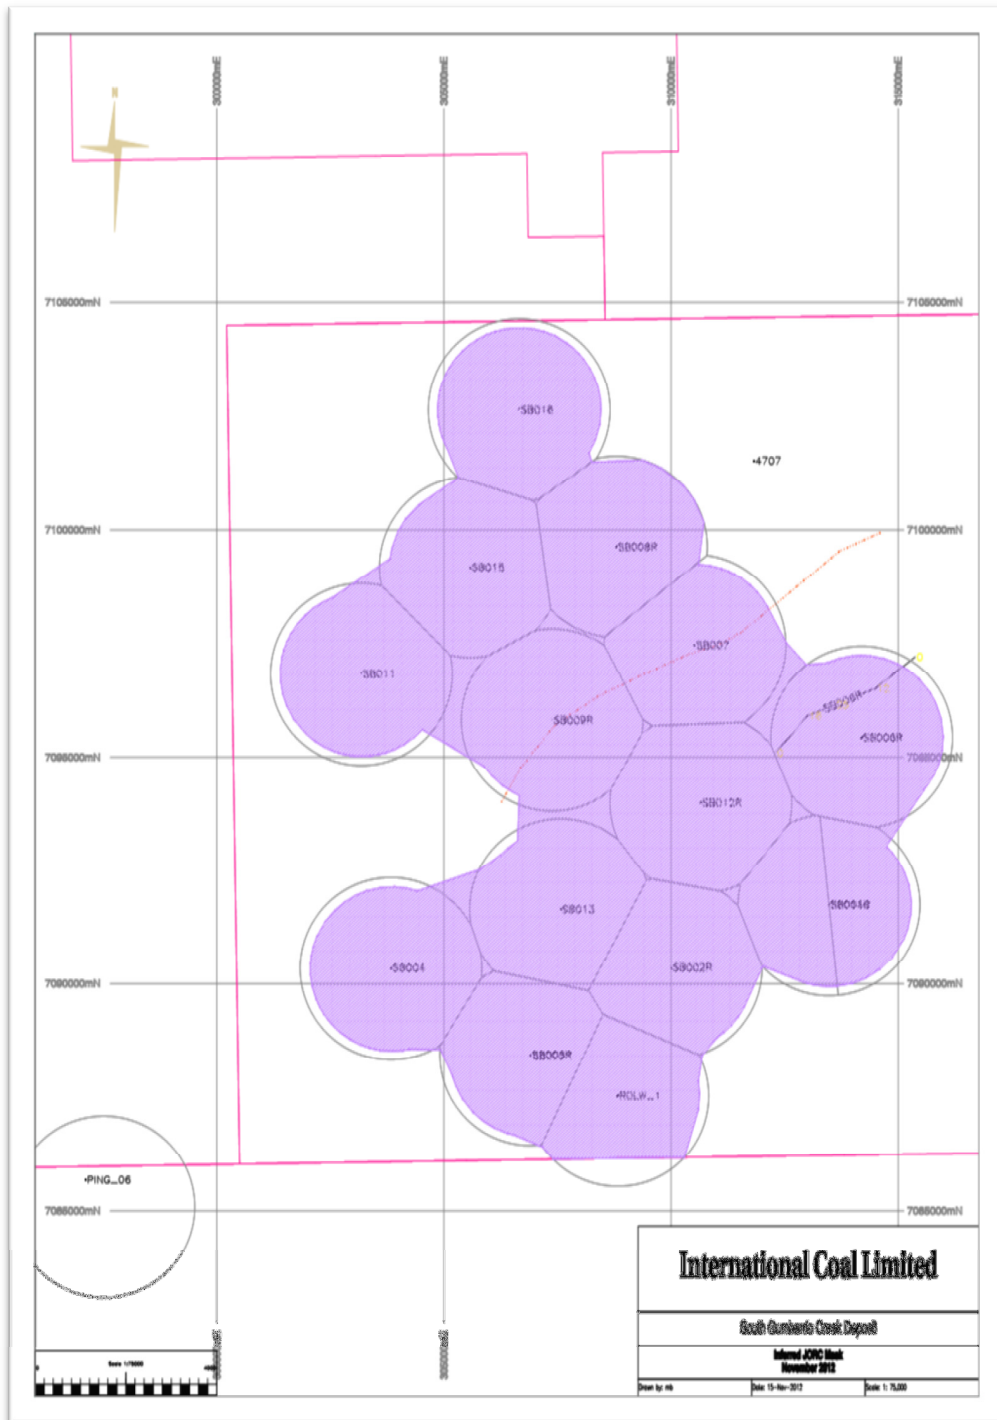

Figure 9 - Inferred Mask for EPC 2197

Figure 10 shows a screen shot of the seam correlation from the Minex model

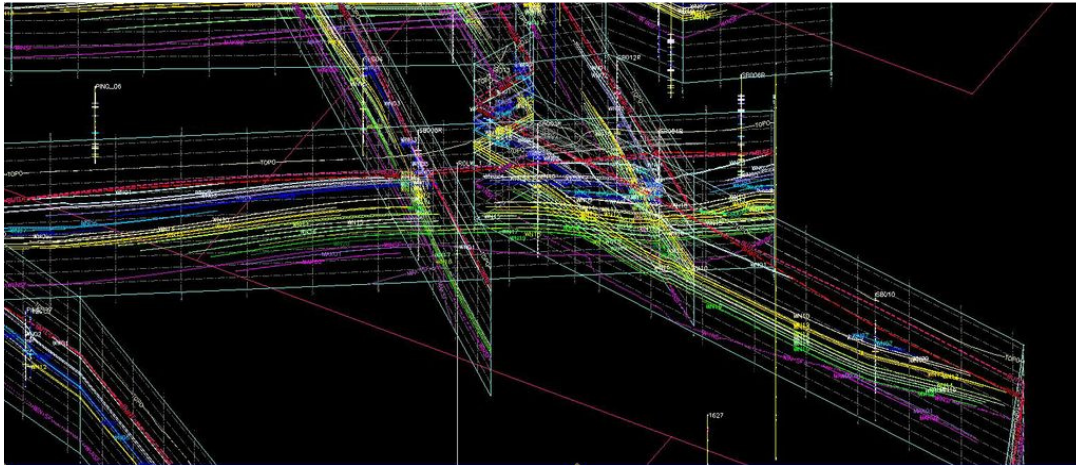

Figure 10 - Seam correlation from the Minex model

A new tonnage estimate has been completed incorporating five of the Stage 2 boreholes as Points of Observation. A total of 1.25Bt has been estimated to the JORC standard, as shown in Figure 11 below:

| Mask | Formation | Seam | Area | Grid Averaged Seam Thickness | Volume | Wet, insitu Relative Density | Mass | Unexpected Geological Loss | Residual Insitu Mass |
|-----------|--------------------|-------|-----------------|------------------------------|-----------------|------------------------------|----------|----------------------------|----------------------|

Notes:
 1.) Based on historical and company drilling
 2.) Total Inferred mask area 149.52 Km²
 3.) Density based on Pingine 2C, 5C, 9C and SB014C
 4.) Unexpected geological loss to account for seam splitting and coalescing

Figure 11 - Inferred Resource Estimation for EPC 2197

Statement of Compliance with MRA Guidelines

The work program carried out is considered to have exceeded the work program required under the specific conditions of the exploration permit. The total exploration expenditure commitment for year 2 of the tenure period was met, and specific details are presented in the Expenditure Statement (submitted with this report).

| Work Program Required | Actual Work Program |
|-------------------------------------|--|
| 6 RAB Holes, Scout drilling program | A total of sixteen (16) holes were drilled for 2,855.7m of chip and 161.95m of HQ-sized diamond core |
| Analysis and Interpretation | Core samples analysed and JORC resource estimate completed |

Proposed work for Year 3 of Tenure

The proposed work program for **2013 – 2014** includes a follow-up drilling program, further data interpretation and analysis and a final review of the resource potential and work on the development of accessible infrastructure that will enable development of the resource at an estimated minimum expenditure, of \$200,000.

Conclusion

An extensive exploration program was carried out on EPC 2197 “South Blackall” during the 12 month reporting period including a large RC drilling program.

The Drilling programme led to a JORC Inferred Resource Estimation of 1.246Bt for the South Blackall Project.
